

modified to support simulation for free running / naturally ventilated buildings by evaluating thermal comfort conditions instead of the energy consumption of the building; WinOpt could then also help in design decisions for low energy/ net zero energy buildings.

ACKNOWLEDGEMENT

The work reported here was an activity of the Center for Building Energy Research and Development (CBERD), which is supported by the Joint Clean Energy Research and Development Center (JCERDC) funded by the Indian Ministry of Science & Technology and the U.S. Department of Energy and administered by Indo-US Science and Technology Forum in India. Work on energy efficiency in buildings at Lawrence Berkeley National Laboratory is supported by the Assistant Secretary for Energy Efficiency and Renewable Energy, Office of Building Technology, State and Community Programs of the U.S. Department of Energy under Contract No. DE-AC02-05CH11231.
