be provided within minimum budget allocations, questioning the role of government authorities to ensure adequate housing conditions. The potential to reduce space heating down to nearly zero and provide thermal comfort all year-round could represent a significant contribution to improve indoor environmental performance and the quality of life of the urban poor, as well as open the debate towards energy autonomy by replacing combustion fuels with clean energy powered by solar energy technologies

ACKNOWLEDGMENTS

This study was carried out as part of a PhD thesis at the *Architectural Association School of Architecture* in London, UK. The author would like to thank to Prof. Simos Yannas and Prof. Paula Cadima for their supervision, support and fruitful advice. This research was supported by the National Commission for Scientific and Technological Research (CONICYT).
